MY AREA OF RESEARCH CHOICE:- My area of research choice would be biophysics and molecular structural biology. The prime reason for my interest in this subject is because I have always been interested in Physics as a subject. Besides I have also been associated with teaching biophysics at undergraduate level in the last four years in my previous employment. During classroom interactions and brainstorming sessions with students, the unanswered questions of lack of a unified theory, origin of the universe and life, the molecular machines and future technologies have always held my attention. Though data and information generated in the run up to sequencing projects have been immense, structure- function relationship and molecular interactions are the complements that will provide mankind with the ultimate tool to understand evolution and ensure survival on this planet and elsewhere in the universe. Astrophysics and cosmology have had always held my interest since childhood and I essentially believe no science is isolated. Work done on life sciences benches will contribute to space exploration and nebular search too.DNA chips and nanotechnology are example of that reciprocal relationship. I understand Theoretical science is also very important as ideas provide us with starting points for technology. A small equation or idea can revolutionize centuries of science. The contribution of theories and innovative ways of thinking can never be undermined in information age. Consequently working in these areas is going to be intellectually quite intriguing and very satisfying for me
